Abstract. In this paper we consider the ideal of p -semi-integral n -linear mappings, which is a natural multilinear extension of the ideal of p -summing linear operators. The space of p -semi-integral multilinear mappings is characterized by means of a suitable tensor norm up to an isometric isomorphism. In this connection we also consider tensor products of linear operators and multilinear mappings of finite type.

Keywords: p -semi integral multilinear mappings, tensor product of Banach spaces

MSC 2000 classification: primary 46G25, secondary 46A32

Introduction

Semi-integral multilinear mappings between Banach spaces were introduced by R. Alencar and M. Matos [1] as a natural multilinear extension of the classical ideal of absolutely summing linear operators. The extension of this notion to p -semi-integral multilinear mappings, $1 \leq p < +\infty$ is immediate [see [2, 11]]. It is shown in [11] that the class of p -semi-integral multilinear mappings has many good properties, e.g. the ideal property [11, Proposição 5.1.11], inclusion property [11, Proposição 5.1.9], etc. [see also [2]]. Also it follows from a result of V. Dimant [4] that p -semi integral multilinear mappings have good properties with respect to the Aron-Berner extensions. As well, R. Alencar and M. Matos in [1] show that every multilinear vector-valued Pietsch-integral mapping is semi integral. We refer to [2] and [11] for the relation between p -semi-integral multilinear mappings and other classes of p -summing multilinear mappings, such as dominated, multiple (or, fully), strongly and absolutely summing mappings.

The aim of this paper is to obtain characterizations of the space $\mathcal{L}_{si,p}(E_1, \dots, E_n; F)$ of p -semi-integral n -linear mappings from $E_1 \times \dots \times E_n$ to F . In Section 2 we introduce a reasonable crossnorm $\tilde{\sigma}_p$ such that the space $\mathcal{L}_{si,p}(E_1, \dots, E_n; F')$ of p -semi-integral n -linear mappings is isometric to the dual

ⁱWe would like to thank Professor Daniel M. Pellegrino and Professor Geraldo Botelho for several helpful conversations and suggestions.

of $E_1 \otimes \cdots \otimes E_n \otimes F$ endowed with $\tilde{\sigma}_p$. A corresponding reasonable crossnorm σ_p for scalar-valued p -semi-integral mappings is also studied. In Section 3 we study the continuity of the tensor product of linear operators with respect to the norm $\tilde{\sigma}_p$ (and σ_p). Finally, in Section 4 we consider the norm $\tilde{\sigma}_p$ (and σ_p) in connection with spaces of multilinear mappings of finite type. Stronger representation results are obtained for multilinear mappings of finite type on reflexive spaces.

The symbols $E, E_1, \dots, E_n, G_1, \dots, G_n, F, F_0$ represent (real or complex) Banach spaces, E' denotes the topological dual of E , \mathbb{K} represents the scalar field and \mathbb{N} represents the set of all positive integers. Given a natural number $n \geq 2$, the Banach space of all continuous n -linear mappings from $E_1 \times \cdots \times E_n$ into F endowed with the sup norm will be denoted by $\mathcal{L}(E_1, \dots, E_n; F)$ ($\mathcal{L}(E_1, \dots, E_n)$ if $F = \mathbb{K}$). For $p \geq 1$, $l_p(E)$ denotes the linear space of absolutely p -summable sequences $(x_j)_{j=1}^\infty$ in E with the norm $\|(x_j)_{j=1}^\infty\|_p = \left(\sum_{j=1}^\infty \|x_j\|^p\right)^{\frac{1}{p}} < \infty$. Also, $l_p^w(E)$ denotes the linear space of the sequences $(x_j)_{j=1}^\infty$ in E such that $(\varphi(x_j))_{j=1}^\infty \in l_p$ for every $\varphi \in E'$. The expression

$$\|(x_j)_{j=1}^\infty\|_{w,p} = \sup_{\varphi \in E'} \|(\varphi(x_j))_{j=1}^\infty\|_p$$

defines a norm on $l_p^w(E)$. If $p = \infty$ we are restricted to the case of bounded sequences and in $l_\infty(E)$ we use the sup norm. The symbol $E_1 \otimes \cdots \otimes E_n$ denotes the algebraic tensor product of the Banach spaces E_1, \dots, E_n .

Let $p \geq 1$. An n -linear mapping $T \in \mathcal{L}(E_1, \dots, E_n; F)$ is *p -semi-integral* ($T \in \mathcal{L}_{si,p}(E_1, \dots, E_n; F)$) if there exist $C \geq 0$ and a regular probability measure μ on the Borel σ -algebra of $B_{E'_1} \times \cdots \times B_{E'_n}$ endowed with the product of the weak star topologies $\sigma(E'_l, E_l)$, $l = 1, \dots, n$, such that

$$\|T(x_1, \dots, x_n)\| \leq C \left(\int_{B_{E'_1} \times \cdots \times B_{E'_n}} |\varphi_1(x_1) \cdots \varphi_n(x_n)|^p d\mu(\varphi_1, \dots, \varphi_n) \right)^{1/p}$$

for every $x_j \in E_j$ and $j = 1, \dots, n$. The infimum of the constants C working in the inequality defines a norm $\|\cdot\|_{si,p}$ on $\mathcal{L}_{si,p}(E_1, \dots, E_n; F)$.

1 p -Semi-Integral Mappings and Tensor Products of Banach Spaces

The following characterization of p -semi-integral mappings, which was proved in [11] [see also [2]] will be important in this paper:

1 Theorem. [11], [2] Let E_1, \dots, E_n and F be Banach spaces and let $p \geq 1$. Then, $T \in \mathcal{L}_{si,p}(E_1, \dots, E_n; F)$ if and only if there exists $C \geq 0$ such that

$$\left(\sum_{j=1}^m \|T(x_{1,j}, \dots, x_{n,j})\|^p \right)^{1/p} \leq C \left(\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p \right)^{1/p} \quad (1)$$

for every $m \in \mathbb{N}$, $x_{l,j} \in E_l$ with $l = 1, \dots, n$ and $j = 1, \dots, m$. Moreover, the infimum of the C in (1) is $\|T\|_{si,p}$.

A standard argument shows that $\mathcal{L}_{si,p}(E_1, \dots, E_n; F)$ is complete with respect to the norm $\|\cdot\|_{si,p}$. Next we introduce a reasonable crossnorm [see [14, p. 127]] on $E_1 \otimes \cdots \otimes E_n \otimes F$ so that the topological dual of the resulting space is isometric to $(\mathcal{L}_{si,p}(E_1, \dots, E_n; F'), \|\cdot\|_{si,p})$.

2 Proposition. Let E_1, \dots, E_n and F be Banach spaces and let $p \geq 1$. Let

$$\tilde{\sigma}_p(u) := \inf \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p \right)^{1/p} \| (b_j)_{j=1}^m \|_\infty$$

where the infimum is taken over all representations of $u \in E_1 \otimes \cdots \otimes E_n \otimes F$ in the form

$$u = \sum_{j=1}^m \lambda_j x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes b_j$$

with $m \in \mathbb{N}$, $x_{l,j} \in E_l$, $l = 1, \dots, n$, $\lambda_j \in \mathbb{K}$, $b_j \in F$, $j = 1, \dots, m$, and $q \geq 1$ with $1/p + 1/q = 1$.

Then the function $\tilde{\sigma}_p$ is a reasonable crossnorm on $E_1 \otimes \cdots \otimes E_n \otimes F$.

For the proof we will need the following lemma.

3 Lemma. Given $u \in E_1 \otimes \cdots \otimes E_n \otimes F$, for any $\delta > 0$ we can find a representation of u of the form

$$u = \sum_{j=1}^m \alpha_j x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes a_j,$$

such that

$$\begin{aligned} \|(\alpha_j)_{j=1}^m\|_q &\leq [(1 + \delta)\tilde{\sigma}_p(u)]^{1/q}, \\ \sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p &\leq (1 + \delta)\tilde{\sigma}_p(u), \end{aligned}$$

$$\| (a_j)_{j=1}^m \|_\infty = 1.$$

PROOF. Let us take a constant $\delta > 0$. It is clear, by the definition of $\tilde{\sigma}_p$, that we can choose a representation of u of the form

$$u = \sum_{j=1}^m \alpha_j x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes a_j,$$

such that

$$\tilde{\sigma}_p(u) \leq \| (\alpha_j)_{j=1}^m \|_q \left(\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m | \varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j}) |^p \right)^{1/p} \| (a_j)_{j=1}^m \|_\infty \tag{*}$$

$$\leq (1 + \delta) \tilde{\sigma}_p(u) = [(1 + \delta) \tilde{\sigma}_p(u)]^{1/q} [(1 + \delta) \tilde{\sigma}_p(u)]^{1/p}.$$

Thus as a first step we can rearrange the representation of u by multiplying and dividing $\| (a_j)_{j=1}^m \|_\infty$ with a suitable constant $c > 0$ so that $\| (a_j^*)_{j=1}^m \|_\infty := \| (ca_j)_{j=1}^m \|_\infty = 1$, and $\| (\alpha_j^*)_{j=1}^m \|_q := \| (\frac{1}{c} \alpha_j)_{j=1}^m \|_q$. Observe that the representation $u = \sum_{j=1}^m \alpha_j^* x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes a_j^*$ satisfies (*) with

$$\| (\alpha_j^*)_{j=1}^m \|_q \left(\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m | \varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j}) |^p \right)^{1/p} \leq [(1 + \delta) \tilde{\sigma}_p(u)]^{1/q} [(1 + \delta) \tilde{\sigma}_p(u)]^{1/p}.$$

Now as a second step, for this representation of u , for example, if

$$\left(\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m | \varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j}) |^p \right)^{1/p} > [(1 + \delta) \tilde{\sigma}_p(u)]^{1/p} \tag{**}$$

again we can choose a suitable constant $C > 0$ so that

$$\left(\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m | \varphi_1(Cx_{1,j}) \cdots \varphi_n(x_{n,j}) |^p \right)^{1/p} = [(1 + \delta) \tilde{\sigma}_p(u)]^{1/p}.$$

Hence, we have that

$$\|(\alpha_j^*)_{j=1}^m\|_q \frac{1}{C} \left(\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(Cx_{1,j}) \cdots \varphi_n(x_{n,j})|^p \right)^{1/p} \| (a_j^*)_{j=1}^m \|_\infty \leq [(1 + \delta)\tilde{\sigma}_p(u)]^{1/q} [(1 + \delta)\tilde{\sigma}_p(u)]^{1/p}$$

and this will imply that $\|(\alpha_j^*)_{j=1}^m\|_q \frac{1}{C} \leq [(1 + \delta)\tilde{\sigma}_p(u)]^{1/q}$. Now taking $\|(\alpha_j^{**})_{j=1}^m\|_q = \|(\frac{1}{C}\alpha_j^*)_{j=1}^m\|_q$ and $x_{1,j}^* = Cx_{1,j}$, $j = 1, \dots, m$ we obtain a representation of u of the form $u = \sum_{j=1}^m \alpha_j^{**} x_{1,j}^* \otimes \cdots \otimes x_{n,j} \otimes a_j^*$ satisfying (*) and conditions

$$\|(\alpha_j^{**})_{j=1}^m\|_q \leq [(1 + \delta)\tilde{\sigma}_p(u)]^{1/q},$$

$$\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}^*) \cdots \varphi_n(x_{n,j})|^p \leq (1 + \delta)\tilde{\sigma}_p(u),$$

$$\|(a_j^*)_{j=1}^m\|_\infty = 1.$$

Note that, in the second step above, if, instead of (**), it would be

$$\|(\alpha_j^*)_{j=1}^m\|_q > [(1 + \delta)\tilde{\sigma}_p(u)]^{1/q}, \tag{***}$$

then we would proceed completely in a similar way to obtain a suitable representation of u satisfying (*) and the above conditions. Note also that, as a consequence of the inequality (*), it cannot happen (**) and (***) simultaneously. QED

PROOF OF PROPOSITION 2. First we show that $\tilde{\sigma}_p(u) = 0$ implies $u = 0$. Suppose that $\tilde{\sigma}_p(u) = 0$. Then, for every $\epsilon > 0$, there is a representation

$\sum_{j=1}^m \lambda_j x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes b_j$ of u such that

$$\|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p \right)^{1/p} \| (b_j)_{j=1}^m \|_\infty < \epsilon.$$

Hence it follows from the Hölder's inequality that

$$\begin{aligned} & \sup_{\substack{\varphi_l \in B_{E'_l}, \varphi \in B_{F'} \\ l=1, \dots, n}} \left| \varphi_1 \times \cdots \times \varphi_n \times \varphi \left(\sum_{j=1}^m \lambda_j x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes b_j \right) \right| \\ &= \sup_{\substack{\varphi_l \in B_{E'_l}, \varphi \in B_{F'} \\ l=1, \dots, n}} \left| \sum_{j=1}^m \varphi_1(\lambda_j x_{1,j}) \cdots \varphi_n(x_{n,j}) \varphi(b_j) \right| \\ &\leq \| (b_j)_{j=1}^m \|_\infty \| (\lambda_j)_{j=1}^m \|_q \left(\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m | \varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j}) |^p \right)^{1/p} < \epsilon. \end{aligned}$$

Thus we have that

$$\left| \sum_{j=1}^m \varphi_1(\lambda_j x_{1,j}) \cdots \varphi_n(x_{n,j}) \varphi(b_j) \right| < \epsilon \| \varphi_1 \| \cdots \| \varphi_n \| \| \varphi \|,$$

for every $\varphi_l \in E'_l, l = 1, \dots, n$ and $\varphi \in F'$.

Since the value of the sum $\left| \varphi_1 \times \cdots \times \varphi_n \times \varphi \left(\sum_{j=1}^m \lambda_j x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes b_j \right) \right|$ is independent of the representation of u , it follows that

$$\sum_{j=1}^m \varphi_1(\lambda_j x_{1,j}) \cdots \varphi_n(x_{n,j}) \varphi(b_j) = 0,$$

for every $\varphi_l \in E'_l, l = 1, \dots, n, \varphi \in F'$.

Hence, since E'_1, \dots, E'_n and F' are separating subsets of the respective algebraic duals, by the multilinear version of [14, Proposition 1.2] it follows that $u = 0$.

To prove the triangular inequality, take $u, v \in E_1 \otimes \cdots \otimes E_n \otimes F$. For any $\delta > 0$, by Lemma 3 we can find representations

$$u = \sum_{j=1}^m \alpha_j x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes a_j \quad \text{and} \quad v = \sum_{j=1}^m \beta_j y_{1,j} \otimes \cdots \otimes y_{n,j} \otimes b_j$$

such that

$$\| (\alpha_j)_{j=1}^m \|_q \leq [(1 + \delta) \tilde{\sigma}_p(u)]^{1/q},$$

$$\begin{aligned} \|(\beta_j)_{j=1}^m\|_q &\leq [(1 + \delta)\tilde{\sigma}_p(v)]^{1/q}, \\ \sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p &\leq (1 + \delta)\tilde{\sigma}_p(u), \\ \sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(y_{1,j}) \cdots \varphi_n(y_{n,j})|^p &\leq (1 + \delta)\tilde{\sigma}_p(v), \\ \|(a_j)_{j=1}^m\|_\infty = 1 &= \|(b_j)_{j=1}^m\|_\infty. \end{aligned}$$

Then it follows that

$$\begin{aligned} \tilde{\sigma}_p(u + v) &\leq \left(\sum_{j=1}^m |\alpha_j|^q + \sum_{j=1}^m |\beta_j|^q \right)^{1/q} \\ &\times \left(\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \left(\sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p + \sum_{j=1}^m |\varphi_1(y_{1,j}) \cdots \varphi_n(y_{n,j})|^p \right) \right)^{1/p} \\ &\leq (1 + \delta)^{1/q} (\tilde{\sigma}_p(u) + \tilde{\sigma}_p(v))^{1/q} (1 + \delta)^{1/p} (\tilde{\sigma}_p(u) + \tilde{\sigma}_p(v))^{1/p} \\ &= (1 + \delta) (\tilde{\sigma}_p(u) + \tilde{\sigma}_p(v)), \end{aligned}$$

which shows the triangular inequality. Hence $\tilde{\sigma}_p$ is a norm on $E_1 \otimes \cdots \otimes E_n \otimes F$.

It is easily seen that $\tilde{\sigma}_p(x_1 \otimes \cdots \otimes x_n \otimes b) \leq \|x_1\| \cdots \|x_n\| \cdot \|b\|$ for every $x_l \in E_l$, $l = 1, \dots, n$ and $b \in F$. To show that $\|\varphi_1 \otimes \cdots \otimes \varphi_n \otimes \varphi\| \leq \|\varphi_1\| \cdots \|\varphi_n\| \cdot \|\varphi\|$ let $\varphi_l \in E'_l$ with $\varphi_l \neq 0$, $l = 1, \dots, n$, let $\varphi \in F'$ with $\varphi \neq 0$, and let $u = \sum_{j=1}^m \lambda_j x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes b_j$. Then by the Hölder's inequality we get

$$\begin{aligned} |\varphi_1 \otimes \cdots \otimes \varphi_n(u)| &\leq \|\varphi\| \|(\lambda_j)_{j=1}^m\|_\infty \|\varphi_1\| \cdots \|\varphi_n\| \|(\lambda_j)_{j=1}^m\|_q \\ &\times \left(\sup_{\substack{\varphi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p \right)^{1/p}. \end{aligned}$$

Therefore we obtain that $|\varphi_1 \otimes \cdots \otimes \varphi_n \otimes \varphi(u)| \leq \|\varphi_1\| \cdots \|\varphi_n\| \|\varphi\| \tilde{\sigma}_p(u)$, and we have shown that $\tilde{\sigma}_p$ is a reasonable crossnorm. \square

Note that when $n = 1$, in particular, the norm $\tilde{\sigma}_p$ is reduced to the Chevet-Saphar norm d_q on $E_1 \otimes F$ [see [14, pg. 135]].

In the previous proposition if we take $F = \mathbb{K}$, then we identify $E_1 \otimes \cdots \otimes E_n \otimes \mathbb{K}$ with $E_1 \otimes \cdots \otimes E_n$, and in this case the corresponding reasonable crossnorm will be denoted by σ_p which is described as follows:

$$\sigma_p(u) := \inf \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\substack{\varphi_l \in B_{E_l'} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p \right)^{1/p}$$

where the infimum is taken over all representations of $u \in E_1 \otimes \cdots \otimes E_n$ in the form $u = \sum_{j=1}^m \lambda_j x_{1,j} \otimes \cdots \otimes x_{n,j}$ with $m \in \mathbb{N}$, $x_{l,j} \in E_l$, $l = 1, \dots, n$, $\lambda_j \in \mathbb{K}$, $j = 1, \dots, m$, and $q \geq 1$ with $\frac{1}{p} + \frac{1}{q} = 1$.

4 Remark. (Commutativity and associativity of σ_p) Let E, F and G be Banach spaces. Since the algebraic isomorphisms $E \otimes F = F \otimes E$ and $E \otimes (F \otimes G) = (E \otimes F) \otimes G$ are well known [see, for example, [7, p. 179]] then it follows by the very definition of σ_p that, the normed (resp. Banach) spaces $(E \otimes F, \sigma_p)$ and $(F \otimes E, \sigma_p)$ (resp. $(E \otimes F, \sigma_p)$ and $(F \otimes E, \sigma_p)$) are isometrically isomorphic, and the normed (resp. Banach) spaces $((E \otimes F, \sigma_p) \otimes G, \sigma_p)$ and $(E \otimes (F \otimes G, \sigma_p), \sigma_p)$ (resp. $((E \otimes F, \sigma_p) \tilde{\otimes} G, \sigma_p)$ and $(E \tilde{\otimes} (F \otimes G, \sigma_p), \sigma_p)$) are isometrically isomorphic in the canonical way, where the symbol $\tilde{\otimes}$ denotes the completion of the corresponding normed space.

The above remark assures that the (reasonable) crossnorm σ_p is symmetric, that is, if we interchange the factor spaces the value of the norm does not alter. Although σ_p and $\tilde{\sigma}_p$ share many properties, let us see that, contrary to the case of σ_p , commutativity and associativity do not hold for $\tilde{\sigma}_p$: take a tensor u in $E \otimes F$ and consider the infima

$$\inf \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\varphi \in B_{E'}} \sum_{j=1}^m |\varphi(x_j)|^p \right)^{1/p} \| (y_j)_{j=1}^m \|_\infty \text{ and}$$

$$\inf \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\phi \in B_{F'}} \sum_{j=1}^m |\phi(y_j)|^p \right)^{1/p} \| (x_j)_{j=1}^m \|_\infty,$$

where the infima are taken over all representations $u = \sum_{j=1}^m \lambda_j x_j \otimes y_j$ with $\lambda_j \in \mathbb{K}$, $x_j \in E$, $y_j \in F$, $j = 1, \dots, m$. The fact that these infima are different

in general shows that $\tilde{\sigma}_p$ is not a symmetric norm. Its non-associativity follows analogously.

5 Remark. Let E_1, \dots, E_n and F be Banach spaces and let $p \geq 1$.

- (a) It follows from the definitions of σ_p and $\tilde{\sigma}_p$ that $\sigma_p(u) \leq \tilde{\sigma}_p(u)$ for every $u \in E_1 \otimes \dots \otimes E_n \otimes F$.
- (b) To each tensor $u \in E'_1 \otimes \dots \otimes E'_n$ corresponds a canonical operator $T_u: E_1 \times \dots \times E_n \rightarrow \mathbb{K}$ given by

$$u = \sum_{j=1}^m \lambda_j \varphi_{1,j} \otimes \dots \otimes \varphi_{n,j} \mapsto T_u = \sum_{j=1}^m \lambda_j \varphi_{1,j} \times \dots \times \varphi_{n,j},$$

with $\lambda_j \in \mathbb{K}$, $\varphi_{l,j} \in E'_l$, $l = 1, \dots, n$, $j = 1, \dots, m$. By an easy application of Hölder's inequality we see that $\|T_u\| \leq \sigma_p(u)$ for every $u \in E'_1 \otimes \dots \otimes E'_n$.

Below by combining the argument of the proof of [9, Theorem 3.7] with Theorem 1 we prove the following result. This result characterizes the space of p -semi integral mappings as the topological dual of the space of the tensor product $(E_1 \otimes \dots \otimes E_n \otimes F, \tilde{\sigma}_p)$ up to an isometric isomorphism.

6 Proposition. Let E_1, \dots, E_n be Banach spaces. Then, for every Banach space F and $p \geq 1$, the space $(\mathcal{L}_{si,p}(E_1, \dots, E_n; F'), \|\cdot\|_{si,p})$ is isometrically isomorphic to $(E_1 \otimes \dots \otimes E_n \otimes F, \tilde{\sigma}_p)'$ through the mapping $T \rightarrow \phi_T$, where $\phi_T(x_1 \otimes \dots \otimes x_n \otimes b) = T(x_1, \dots, x_n)(b)$, for every $x_l \in E_l$, $l = 1, \dots, n$, and $b \in F$.

PROOF. It is easy to see that the correspondence

$$T \in \mathcal{L}_{si,p}(E_1, \dots, E_n; F') \rightarrow \phi_T \in (E_1 \otimes \dots \otimes E_n \otimes F, \tilde{\sigma}_p)'$$

defined by

$$\phi_T(x_1 \otimes \dots \otimes x_n \otimes b) := T(x_1, \dots, x_n)(b), \quad x_l \in E_l, \quad l = 1, \dots, n \text{ and } b \in F,$$

is linear and injective. To show the surjectivity let $\phi \in (E_1 \otimes \dots \otimes E_n \otimes F, \tilde{\sigma}_p)'$ and consider the corresponding n -linear mapping $T_\phi \in \mathcal{L}(E_1, \dots, E_n; F')$, defined by $T_\phi(x_1, \dots, x_n)(b) = \phi(x_1 \otimes \dots \otimes x_n \otimes b)$, for $x_l \in E_l$, $l = 1, \dots, n$, and $b \in F$. Let us consider $x_{l,j} \in E_l$, $l = 1, \dots, n$, $j = 1, \dots, m$. For every $\epsilon > 0$ there are $b_j \in F$, with $\|b_j\| = 1$, $j = 1, \dots, m$, such that

$$\begin{aligned} \|(T_\phi(x_{1,j}, \dots, x_{n,j}))_{j=1}^m\|_p^p &= \sum_{j=1}^m \|T_\phi(x_{1,j}, \dots, x_{n,j})\|^p \\ &\leq \epsilon + \sum_{j=1}^m |T_\phi(x_{1,j}, \dots, x_{n,j})(b_j)|^p = (*). \end{aligned}$$

Now we can choose $\lambda_j \in \mathbb{K}$, with $|\lambda_j| = 1$, $j = 1, \dots, m$, such that

$$\begin{aligned} (*) &= \epsilon + \sum_{j=1}^m |\phi(x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes b_j)|^p \\ &= \epsilon + \left| \sum_{j=1}^m |\phi(x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes b_j)|^{p-1} \lambda_j \phi(x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes b_j) \right| = (**). \end{aligned}$$

Proceeding from this point, by continuity of ϕ and the Hölder's inequality we get

$$\begin{aligned} (**) &\leq \epsilon + \|\phi\|_{(E_1 \otimes \cdots \otimes E_n \otimes F, \tilde{\sigma}_p)'} \tilde{\sigma}_p \\ &\quad \left(\sum_{j=1}^m \lambda_j |\phi(x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes b_j)|^{p-1} x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes b_j \right) \\ &\leq \epsilon + \|\phi\|_{(E_1 \otimes \cdots \otimes E_n \otimes F, \tilde{\sigma}_p)'} \left\| (\lambda_j |\phi(x_{1,j} \otimes \cdots \otimes x_{n,j} \otimes b_j)|^{p-1})_{j=1}^m \right\|_q \\ &\quad \times \left(\sup_{\substack{\varphi_l \in B_{E_l'} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p \right)^{1/p} \| (b_j)_{j=1}^m \|_\infty \\ &= \epsilon + \|\phi\|_{(E_1 \otimes \cdots \otimes E_n \otimes F, \tilde{\sigma}_p)'} \left\| (T_\phi(x_{1,j}, \dots, x_{n,j}))_{j=1}^m \right\|_p^{p/q} \\ &\quad \left(\sup_{\substack{\varphi_l \in B_{E_l'} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p \right)^{1/p}. \end{aligned}$$

Since ϵ is arbitrary and $p - (p/q) = 1$ we obtain

$$\| (T_\phi(x_{1,j}, \dots, x_{1,j}))_{j=1}^m \|_p \leq \|\phi\|_{(E_1 \otimes \cdots \otimes E_n \otimes F, \tilde{\sigma}_p)'} \left(\sup_{\substack{\varphi_l \in B_{E_l'} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p \right)^{1/p},$$

showing that $\|T_\phi\|_{si,p} \leq \|\phi\|_{(E_1 \otimes \cdots \otimes E_n \otimes F, \tilde{\sigma}_p)'}$, and therefore $T_\phi \in (\mathcal{L}_{si,p}(E_1, \dots, E_n; F'), \|\cdot\|_{si,p})$.

To show the reverse inequality let $T \in \mathcal{L}_{si,p}(E_1, \dots, E_n; F')$ and consider the linear functional ϕ_T on $E_1 \otimes \dots \otimes E_n \otimes F$ given by

$$\phi_T(u) = \sum_{j=1}^m \lambda_j T(x_{1,j}, \dots, x_{n,j})(b_j)$$

for $u = \sum_{j=1}^m \lambda_j x_{1,j} \otimes \dots \otimes x_{n,j} \otimes b_j$, where $m \in \mathbb{N}$, $\lambda_j \in \mathbb{K}$, $k = 1, \dots, n$, $b_j \in F$, $j = 1, \dots, m$. Hence, by Hölder's inequality and Theorem 1 it follows that

$$|\phi_T(u)|^p \leq \|(\lambda_j)_{j=1}^m\|_q^p \| (b_j)_{j=1}^m \|_\infty^p \|T\|_{si,p}^p \sup_{\substack{\varphi_l \in B_{E_l'} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p.$$

Thus $|\phi_T(u)| \leq \|T\|_{si,p} \tilde{\sigma}_p(u)$, showing that ϕ_T is $\tilde{\sigma}_p$ -continuous with $\|\phi_T\|_{(E_1 \otimes \dots \otimes E_n \otimes F, \tilde{\sigma}_p)'} \leq \|T\|_{si,p}$. \overline{QED}

Making $F = \mathbb{K}$, in the previous Proposition we obtain that for every Banach spaces E_1, \dots, E_n , and $p \geq 1$, the space of p -semi-integral forms $(\mathcal{L}_{si,p}(E_1, \dots, E_n), \|\cdot\|_{si,p})$ is isometric to $(E_1 \otimes \dots \otimes E_n \otimes \mathbb{K}, \tilde{\sigma}_p)'$.

On the other hand, by a slight modification of the proof of Proposition 6, alternatively, we obtain the representation of the space of p -semi-integral forms as the dual of the tensor product endowed with the σ_p -norm.

7 Proposition. *Let E_1, \dots, E_n be Banach spaces, and let $p \geq 1$. Then $(\mathcal{L}_{si,p}(E_1, \dots, E_n), \|\cdot\|_{si,p})$ is isometrically isomorphic to $(E_1 \otimes \dots \otimes E_n, \sigma_p)'$ through the mapping $T \rightarrow \phi_T$, where $\phi_T(x_1 \otimes \dots \otimes x_n) = T(x_1, \dots, x_n)$ for every $x_l \in E_l$, $l = 1, \dots, n$.*

It is interesting to observe that $(E_1 \otimes \dots \otimes E_n \otimes \mathbb{K}, \tilde{\sigma}_p)'$ is not isometric to $(E_1 \otimes \dots \otimes E_n, \tilde{\sigma}_p)'$, but as a consequence of Propositions 6 and 7 we see that $(E_1 \otimes \dots \otimes E_n \otimes \mathbb{K}, \tilde{\sigma}_p)'$ is isometric to $(E_1 \otimes \dots \otimes E_n, \sigma_p)'$.

Recall that a linear operator $u : E \rightarrow F$ is said to be absolutely p -summing if $(u(x_j))_{j=1}^\infty \in l_p(F)$ whenever $(x_j)_{j=1}^\infty \in l_p^w(E)$. The vector space (operator ideal) composed by all absolutely p -summing operators from E to F is denoted by $\mathcal{L}_{as,p}(E; F)$. Hence the class of absolutely p -summing linear mappings coincides with the class of p -semi integral linear mappings. So in the linear case we prefer to write $\mathcal{L}_{as,p}(E; F)$ (resp. $\|\cdot\|_{as,p}$) instead of $\mathcal{L}_{si,p}(E; F)$ (resp. $\|\cdot\|_{si,p}$). For the theory of absolutely summing operators we refer to [3].

Below, inspired by a result of D. Pérez-García [12], we show that the norm σ_p is well behaved in connection with p -semi integral mappings.

8 Proposition. *Let E_1, \dots, E_n and F be Banach spaces and let $p \geq 1$. Then we have the following:*

(a) If $T : E_1 \otimes \cdots \otimes E_n \rightarrow F$ is a linear operator, then $T \in \mathcal{L}((E_1 \widetilde{\otimes} \cdots \widetilde{\otimes} E_n, \sigma_p); F)$ if and only if $\varphi \circ T \in (E_1 \widetilde{\otimes} \cdots \widetilde{\otimes} E_n, \sigma_p)'$ for every $\varphi \in B_{F'}$. In this case we have:

$$\| T \|_{\mathcal{L}((E_1 \widetilde{\otimes} \cdots \widetilde{\otimes} E_n, \sigma_p); F)} = \sup_{\varphi \in B_{F'}} \| \varphi \circ T \|_{(E_1 \widetilde{\otimes} \cdots \widetilde{\otimes} E_n, \sigma_p)'}$$

(b) A multilinear mapping $T : E_1 \times \cdots \times E_n \rightarrow F$ is p -semi integral if its associated linear mapping $\widetilde{T} : E_1 \otimes \cdots \otimes E_n \rightarrow F$, given by $\widetilde{T}(x_1 \otimes \cdots \otimes x_n) = T(x_1, \dots, x_n)$ for every $x_l \in E_l, l = 1, \dots, n$, is σ_p -continuous and p -semi integral. In this case we have

$$\| T \| \leq \| T \|_{si,p} \leq \| \widetilde{T} \|_{si,p}$$

Conversely, if $T \in \mathcal{L}_{si,p}(E_1, \dots, E_n; F)$, then the associated linear mapping \widetilde{T} is σ_p -continuous, that is, $\widetilde{T} \in \mathcal{L}((E_1 \otimes \cdots \otimes E_n, \sigma_p); F)$. In this case we have:

$$\| T \| \leq \| \widetilde{T} \|_{\mathcal{L}((E_1 \otimes \cdots \otimes E_n, \sigma_p); F)} \leq \| T \|_{si,p}$$

PROOF. (a) The non-trivial implication of the first assertion is an easy consequence of the closed graph theorem. To show the second assertion let $u_0 \in E_1 \otimes \cdots \otimes E_n$ with $Tu_0 \neq 0$. Then by the Hanh-Banach Theorem there exists a $\varphi_0 \in B_{F'}$ such that $\varphi_0(Tu_0) = \| Tu_0 \|$. Therefore for every $\varphi \in B_{F'}$ we have that

$$\| Tu_0 \| \leq \sup_{\varphi \in B_{F'}} | \varphi \circ T(u_0) | \leq \sup_{\varphi \in B_{F'}} \| \varphi \circ T \|_{(E_1 \widetilde{\otimes} \cdots \widetilde{\otimes} E_n, \sigma_p)'} \sigma_p(u_0),$$

which shows that

$$\| T \|_{\mathcal{L}((E_1 \widetilde{\otimes} \cdots \widetilde{\otimes} E_n, \sigma_p); F)} \leq \sup_{\varphi \in B_{F'}} \| \varphi \circ T \|_{(E_1 \widetilde{\otimes} \cdots \widetilde{\otimes} E_n, \sigma_p)'}$$

Since the reverse inequality is immediate we have (a).

(b) Suppose $\widetilde{T} \in \mathcal{L}_{si,p}((E_1 \otimes \cdots \otimes E_n, \sigma_p); F)$. Then by Proposition 7 and

Theorem 1 it follows that

$$\begin{aligned}
 & \left(\sum_{j=1}^m \|T(x_{1,j}, \dots, x_{n,j})\|^p \right)^{1/p} \\
 & \leq \| \tilde{T} \|_{si,p} \left(\sup_{\varphi \in B_{(E_1 \otimes \dots \otimes E_n, \sigma_p)'}} \sum_{j=1}^m |\varphi(x_{1,j} \otimes \dots \otimes x_{n,j})|^p \right)^{1/p} \\
 & = \| \tilde{T} \|_{si,p} \left(\sup_{S \in B_{(\mathcal{L}_{si,p}(E_1, \dots, E_n), \|\cdot\|_{si,p})}} \sum_{j=1}^m |S(x_{1,j}, \dots, x_{n,j})|^p \right)^{1/p} \\
 & \leq \| \tilde{T} \|_{si,p} \left(\sup_{\substack{\varphi_l \in B_{E_l'} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p \right)^{1/p},
 \end{aligned}$$

which shows that $T \in \mathcal{L}_{si,p}(E_1, \dots, E_n; F)$ with $\| T \|_{si,p} \leq \| \tilde{T} \|_{si,p}$. The fact that $\| T \| \leq \| T \|_{si,p}$ follows easily from Theorem 1.

To show the converse, suppose now $T \in \mathcal{L}_{si,p}(E_1, \dots, E_n; F)$, and let $u \in E_1 \otimes \dots \otimes E_n$. Choosing a representation $u = \sum_{j=1}^m \lambda_j x_{1,j} \otimes \dots \otimes x_{n,j}$, from the Hölder's inequality and Theorem 1 it follows that

$$\begin{aligned}
 \| \tilde{T}(u) \|^p & \leq \| (\lambda_j)_{j=1}^m \|_q^p \sum_{j=1}^m \| T(x_{1,j}, \dots, x_{n,j}) \|^p \\
 & \leq \| (\lambda_j)_{j=1}^m \|_q^p \| T \|_{si,p}^p \sup_{\substack{\varphi_l \in B_{E_l'} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_1(x_{1,j}) \cdots \varphi_n(x_{n,j})|^p.
 \end{aligned}$$

Hence $\| \tilde{T}(u) \| \leq \| T \|_{si,p} \sigma_p(u)$, and so \tilde{T} is σ_p -continuous with $\| \tilde{T} \|_{\mathcal{L}((E_1 \otimes \dots \otimes E_n, \sigma_p); F)} \leq \| T \|_{si,p}$. Finally, since σ_p is a reasonable cross-norm, it readily follows that $\| T \| \leq \| \tilde{T} \|_{\mathcal{L}((E_1 \otimes \dots \otimes E_n, \sigma_p); F)}$, which completes the proof of (b).

◻

Proposition 8(b) can be seen as a weak vector-valued version of Proposition 7. We do not know if, in general, $\tilde{T} \in \mathcal{L}_{si,p}((E_1 \otimes \dots \otimes E_n, \sigma_p); F)$ whenever $T \in \mathcal{L}_{si,p}(E_1, \dots, E_n; F)$.

We end this section by giving another property of the p -semi integral multilinear mappings.

9 Proposition. [11, Teorema 5.1.14] If $T \in \mathcal{L}_{si,p}(E_1, \dots, E_n; F)$ then, for each $i = 1, \dots, n$, the mapping $T_i: E_i \rightarrow \mathcal{L}(E_1, \dots, E_n; F)$, defined by $T_i(x_i)(x_1, \dots, x_n) := T(x_1, \dots, x_n)$, is absolutely p -summing with $T_i(x_i) \in \mathcal{L}_{si,p}(E_1, \dots, E_n; F)$. Furthermore,

$$\|T\| = \|T_i\| \leq \|T_i\|_{as,p} \leq \|T\|_{si,p}.$$

PROOF. A close examination of the proof of [11, Teorema 5.1.14] gives the first part. Since it is readily seen that $\|T\| = \|T_i\|$ and, it follows by Proposition 8(b) that $\|T_i\| \leq \|T_i\|_{si,p}$, we have the proof. QED

2 Tensor Product of Operators

In this section we consider the tensor product of linear operators in connection with the reasonable crossnorm $\tilde{\sigma}_p$ (and σ_p). We show that the reasonable crossnorms $\tilde{\sigma}_p$ and σ_p are actually tensor norms. The results of this section are similar to those ones given for the projective tensor product in connection with bilinear mappings in [14] with the same patterns in corresponding proofs [see [14, Propositions 2.3 and 2.4]].

In what follows we use the notation $\tilde{\sigma}_{p;E_1, \dots, E_n}$ to emphasize that the crossnorm $\tilde{\sigma}_p$ is considered on $E_1 \otimes \dots \otimes E_n$.

10 Proposition. Let $T_i \in \mathcal{L}(E_i; F_i)$, $i = 1, \dots, n$, $T \in \mathcal{L}(E; F)$ and $p \geq 1$. Then there is a unique continuous linear operator $T_1 \otimes_{\tilde{\sigma}_p} \dots \otimes_{\tilde{\sigma}_p} T_n \otimes_{\tilde{\sigma}_p} T: (E_1 \tilde{\otimes} \dots \tilde{\otimes} E_n \tilde{\otimes} E, \tilde{\sigma}_p) \rightarrow (F_1 \tilde{\otimes} \dots \tilde{\otimes} F_n \tilde{\otimes} F, \tilde{\sigma}_p)$ such that

$$T_1 \otimes_{\tilde{\sigma}_p} \dots \otimes_{\tilde{\sigma}_p} T_n \otimes_{\tilde{\sigma}_p} T(x_1 \otimes \dots \otimes x_n \otimes x) = (T_1 x_1) \otimes \dots \otimes (T_n x_n) \otimes (Tx)$$

for every $x_i \in E_i$, $i = 1, \dots, n$, and $x \in E$. Moreover

$$\|T_1 \otimes_{\tilde{\sigma}_p} \dots \otimes_{\tilde{\sigma}_p} T_n \otimes_{\tilde{\sigma}_p} T\| = \|T_1 \otimes \dots \otimes T_n \otimes T\| = \|T_1\| \dots \|T_n\| \|T\|.$$

PROOF. Given linear operators $T_i \in \mathcal{L}(E_i; F_i)$, $i = 1, \dots, n$, and $T \in \mathcal{L}(E; F)$, there is a unique linear operator $T_1 \otimes \dots \otimes T_n \otimes T: E_1 \otimes \dots \otimes E_n \otimes E \rightarrow F_1 \otimes \dots \otimes F_n \otimes F$ such that

$$T_1 \otimes \dots \otimes T_n \otimes T(x_1 \otimes \dots \otimes x_n \otimes x) = (T_1 x_1) \otimes \dots \otimes (T_n x_n) \otimes (Tx)$$

for every $x_i \in E_i$, $i = 1, \dots, n$ and $x \in E$ [see [14, p. 7]]. We may suppose $T_i \neq 0$,

$i = 1, \dots, n$ and $T \neq 0$. Let $u \in E_1 \otimes \dots \otimes E_n \otimes E$ and let $\sum_{j=1}^m \lambda_j x_{1,j} \otimes \dots \otimes x_{n,j} \otimes x_j$

be a representation of u . Hence the sum

$$\sum_{j=1}^m \lambda_j T_1(x_{1,j}) \otimes \dots \otimes T_n(x_{n,j}) \otimes T(x_j)$$

is a representation of $T_1 \otimes \cdots \otimes T_n \otimes T(u)$ in $F_1 \otimes \cdots \otimes F_n \otimes F$. Then, for every $p \geq 1$

$$\begin{aligned} & \tilde{\sigma}_{p;F_1,\dots,F_n,F}(T_1 \otimes \cdots \otimes T_n \otimes T(u)) \\ & \leq \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\substack{\phi_l \in B_{F_l'} \\ l=1,\dots,n}} \sum_{j=1}^m |\phi_1(T_1 x_{1,j}) \cdots \phi_n(T_n x_{n,j})|^p \right)^{1/p} \| (Tx_j)_{j=1}^m \|_\infty \\ & \leq \|T_1\| \cdots \|T_n\| \|T\| \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\substack{\phi_l \in B_{E_l'} \\ l=1,\dots,n}} \sum_{j=1}^m |\phi_1(x_{1,j}) \cdots \phi_n(x_{n,j})|^p \right)^{1/p} \| (x_j)_{j=1}^m \|_\infty \end{aligned}$$

and we have that

$$\tilde{\sigma}_{p;F_1,\dots,F_n,F}(T_1 \otimes \cdots \otimes T_n \otimes T(u)) \leq \|T_1\| \cdots \|T_n\| \|T\| \tilde{\sigma}_{p;E_1,\dots,E_n,E}(u),$$

so that the linear operator $T_1 \otimes \cdots \otimes T_n \otimes T$ is continuous for the crossnorms on $E_1 \otimes \cdots \otimes E_n \otimes E$ and $F_1 \otimes \cdots \otimes F_n \otimes F$ and $\|T_1 \otimes \cdots \otimes T_n \otimes T\| \leq \|T_1\| \cdots \|T_n\| \|T\|$. On the other hand, as $\tilde{\sigma}_p$ is an reasonable crossnorm we get that

$$\begin{aligned} \|T_1(x_1)\| \cdots \|T_n(x_n)\| \|T(x)\| &= \tilde{\sigma}_{p;F_1,\dots,F_n,F}(T_1(x_1) \otimes \cdots \otimes T_n(x_n) \otimes T(x)) \\ &\leq \|T_1 \otimes \cdots \otimes T_n \otimes T\| \tilde{\sigma}_{p;E_1,\dots,E_n,E}(x_1 \otimes \cdots \otimes x_n \otimes x) \\ &= \|T_1 \otimes \cdots \otimes T_n \otimes T\| \|x_1\| \cdots \|x_n\| \|x\|, \end{aligned}$$

[see [14, Proposition 6.1]], and therefore $\|T_1 \otimes \cdots \otimes T_n \otimes T\| \geq \|T_1\| \cdots \|T_n\| \|T\|$. Hence we have that

$$\|T_1 \otimes \cdots \otimes T_n \otimes T\| = \|T_1\| \cdots \|T_n\| \|T\|$$

Now taking the unique continuous extension of the operator $T_1 \otimes \cdots \otimes T_n \otimes T$ to the completions of $(E_1 \otimes \cdots \otimes E_n \otimes E, \tilde{\sigma}_p)$ and $(F_1 \otimes \cdots \otimes F_n \otimes F, \tilde{\sigma}_p)$, which we denote by $T_1 \otimes_{\tilde{\sigma}_p} \cdots \otimes_{\tilde{\sigma}_p} T_n \otimes_{\tilde{\sigma}_p} T$, we obtain a unique linear operator from $(E_1 \hat{\otimes} \cdots \hat{\otimes} E_n \hat{\otimes} E, \tilde{\sigma}_p)$ into $(F_1 \hat{\otimes} \cdots \hat{\otimes} F_n \hat{\otimes} F, \tilde{\sigma}_p)$ with the norm $\|T_1 \otimes_{\tilde{\sigma}_p} \cdots \otimes_{\tilde{\sigma}_p} T_n \otimes_{\tilde{\sigma}_p} T\| = \|T_1\| \cdots \|T_n\| \|T\|$. QED

The $\tilde{\sigma}_p$ -tensor product does not respect subspaces but respects 1-complemented subspaces. Indeed; if E_0 is a subspace of E , then $E_0 \otimes F$ is an algebraic subspace of $E \otimes F$, but the norm induced on $E_0 \otimes F$ by $(E \otimes F, \tilde{\sigma}_p)$ is not, in

general the $\tilde{\sigma}_p$ norm on $E_0 \otimes F$. In fact, if we take $u \in E_0 \otimes F$, then we see that

$$\begin{aligned} \tilde{\sigma}_{p;E,F}(u) &= \inf \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\varphi \in B_{E'}} \sum_{j=1}^m |\varphi(x_j)|^p \right)^{1/p} \| (y_j)_{j=1}^m \|_\infty \\ &\leq \inf \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\psi \in B_{E'_0}} \sum_{j=1}^m |\psi(x_j)|^p \right)^{1/p} \| (y_j)_{j=1}^m \|_\infty = \tilde{\sigma}_{p;E_0,F}(u) \end{aligned}$$

since the set of representations of u become bigger when we enlarge the space E_0 to E . Similarly if F_0 is a subspace of F , then $E \otimes F_0$ is an algebraic subspace of $E \otimes F$, but the norm induced on $E \otimes F_0$ by $(E \otimes F, \tilde{\sigma}_p)$ is not, in general the $\tilde{\sigma}_p$ norm on $E \otimes F_0$. Whereas for complemented subspaces we have:

11 Proposition. *Let M_1, \dots, M_n, N be complemented subspaces of E_1, \dots, E_n, F respectively. Then $M_1 \otimes \dots \otimes M_n \otimes N$ is complemented in $(E_1 \otimes \dots \otimes E_n \otimes F, \tilde{\sigma}_p)$ and the norm on $M_1 \otimes \dots \otimes M_n \otimes N$ induced by $\tilde{\sigma}_{p;E_1, \dots, E_n, F}$ is equivalent to $\tilde{\sigma}_{p;M_1, \dots, M_n, N}$. Moreover, if M_1, \dots, M_n and N are 1-complemented, then $(M_1 \otimes \dots \otimes M_n \otimes N, \tilde{\sigma}_p)$ is 1-complemented in $(E_1 \otimes \dots \otimes E_n \otimes F, \tilde{\sigma}_p)$ as well.*

PROOF. Let P_1, \dots, P_n, Q be projections from E_1, \dots, E_n, F onto M_1, \dots, M_n, N respectively. One can easily show that $P_1 \otimes \dots \otimes P_n \otimes Q$ is a projection of $(E_1 \otimes \dots \otimes E_n \otimes F, \tilde{\sigma}_p)$ onto $M_1 \otimes \dots \otimes M_n \otimes N$. We just have proved above that $\tilde{\sigma}_{p;E,F}(u) \leq \tilde{\sigma}_{p;M,N}(u)$ for $u \in M \otimes N$, and the same argument shows that $\tilde{\sigma}_{p;E_1, \dots, E_n, F}(u) \leq \tilde{\sigma}_{p;M_1, \dots, M_n, N}(u)$ for $u \in M_1 \otimes \dots \otimes M_n \otimes N$.

Let $u \in M_1 \otimes \dots \otimes M_n \otimes N$ and let $\sum_{j=1}^m \lambda_j x_{1,j} \dots \otimes x_{n,j} \otimes y_j$ be a representation of u in $E_1 \otimes \dots \otimes E_n \otimes F$. Then $u = P_1 \otimes \dots \otimes P_n \otimes Q(u) = \sum_{j=1}^m \lambda_j P_1(x_{1,j}) \otimes \dots \otimes P_n(x_{n,j}) \otimes Q(y_j)$ is a representation of u in $M_1 \otimes \dots \otimes M_n \otimes N$. Therefore, by the argument used in the proof of Proposition 10 we obtain

$$\begin{aligned} &\tilde{\sigma}_{p;M_1, \dots, M_n, N}(u) \\ &\leq \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\substack{\phi_l \in B_{M'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\phi_1(P_1(x_{1,j})) \dots \phi_n(P_n(x_{n,j}))|^p \right)^{1/p} \| (Q(y_j))_{j=1}^m \|_\infty \\ &\leq \|P_1\| \dots \|P_n\| \|Q\| \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\substack{\phi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\phi_1(x_{1,j}) \dots \phi_n(x_{n,j})|^p \right)^{1/p} \| (y_j)_{j=1}^m \|_\infty. \end{aligned}$$

Since this holds for every representation of u in $E_1 \otimes \cdots \otimes E_n \otimes F$, it follows that

$$\tilde{\sigma}_{p;E_1,\dots,E_n,F}(u) \leq \tilde{\sigma}_{p;M_1,\dots,M_n,N}(u) \leq \|P_1\| \cdots \|P_n\| \|Q\| \tilde{\sigma}_{p;E_1,\dots,E_n,F}(u).$$

Now, if M_1, \dots, M_n and N are complemented by projections of norm one, then we have that $\tilde{\sigma}_{p;E_1,\dots,E_n,F}(u) = \tilde{\sigma}_{p;M_1,\dots,M_n,N}(u)$ for every $u \in M_1 \otimes \cdots \otimes M_n \otimes N$, and by Proposition 10 it follows that $\|P_1 \otimes \cdots \otimes P_n \otimes Q\| = \|P_1\| \cdots \|P_n\| \|Q\| = 1$, as we desired. \square

We note that an analogous result to Proposition 10, in a similar way, can be obtained for σ_p also. As well, like the case of $\tilde{\sigma}_p$, and with analogous reasonings, the σ_p -tensor product does not respect subspaces but respects 1-complemented subspaces.

3 Connection with multilinear mappings of finite type

We recall that a multilinear mapping $T \in \mathcal{L}(E_1, \dots, E_n; F)$ is said to be of finite type if it has a finite representation of the form

$$T = \sum_{j=1}^m \lambda_j \varphi_{1,j} \times \cdots \times \varphi_{n,j} b_j \tag{2}$$

where $\lambda_j \in \mathbb{K}$, $\varphi_{l,j} \in E'_l$, $l = 1, \dots, n$, $b_j \in F$, $j = 1, \dots, m$. We denote by $\mathcal{L}_f(E_1, \dots, E_n; F)$ the vector subspace of $\mathcal{L}(E_1, \dots, E_n; F)$ of all n -linear mappings of finite type. It is plain that multilinear mappings of finite type are p -semi-integral, that is, $\mathcal{L}_f(E_1, \dots, E_n; F) \subset \mathcal{L}_{si,p}(E_1, \dots, E_n; F)$. It is clear that to each operator in $\mathcal{L}_f(E_1, \dots, E_n; F)$ corresponds a tensor in $E'_1 \otimes \cdots \otimes E'_n \otimes F$ via the canonical mapping

$$u = \sum_{j=1}^m \lambda_j \varphi_{1,j} \otimes \cdots \otimes \varphi_{n,j} \otimes b_j \longrightarrow T_u = \sum_{j=1}^m \lambda_j \varphi_{1,j} \times \cdots \times \varphi_{n,j} b_j, \tag{3}$$

where $\lambda_j \in \mathbb{K}$, $\varphi_{l,j} \in E'_l$, $l = 1, \dots, n$, $b_j \in F$, $j = 1, \dots, m$. Next we will see that, in some cases, these mappings are isometries.

12 Proposition. *Let E_1, \dots, E_n and F be Banach spaces and let $p \geq 1$. Given $T \in \mathcal{L}_f(E_1, \dots, E_n; F)$, define*

$$\|T\|_{f,p} := \inf \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\substack{\phi_l \in B_{E'_l} \\ l=1,\dots,n}} \sum_{j=1}^m |\phi_1(\varphi_{1,j}) \cdots \phi_n(\varphi_{n,j})|^p \right)^{1/p} \| (b_j)_{j=1}^m \|_\infty$$

where the infimum is taken over all representations of T as in (2), and $q \geq 1$ with $\frac{1}{p} + \frac{1}{q} = 1$.

Then $\|\cdot\|_{f,p}$ is a norm on $\mathcal{L}_f(E_1, \dots, E_n; F)$ with the following properties :

- (a) For every $u \in E'_1 \otimes \dots \otimes E'_n \otimes F$ we have that $\|T_u\| \leq \|T_u\|_{f,p} = \tilde{\sigma}_p(u)$.
 Consequently, $(\mathcal{L}_f(E_1, \dots, E_n; F), \|\cdot\|_{f,p})$ is isometrically isomorphic to $(E'_1 \otimes \dots \otimes E'_n \otimes F, \tilde{\sigma}_p)$ via the mapping given in (3).
- (b) For every $\varphi_l \in E'_l$, $l = 1, \dots, n$, and $b \in F$ we have that $\|\varphi_1 \times \dots \times \varphi_n b\|_{f,p} = \|\varphi_1\| \cdots \|\varphi_n\| \cdot \|b\|$.

PROOF. Following the lines of the proof of Proposition 2 it is easy to see that $\|\cdot\|_{f,p}$ is a norm on $\mathcal{L}_f(E_1, \dots, E_n; F)$.

- (a) Since the equality $\|T_u\|_{f,p} = \tilde{\sigma}_p(u)$ is trivial we show that $\|T_u\| \leq \|T_u\|_{f,p}$. Given $x_l \in E_l$ with $x_l \neq 0$, $l = 1, \dots, n$, by Hölder's inequality we have

$$\begin{aligned} & \|T_u(x_1, \dots, x_n)\|^p \\ & \leq \|x_1\|^p \cdots \|x_n\|^p \| (b_j)_{j=1}^m \|_\infty^p \|(\lambda_j)_{j=1}^m\|_q^p \sup_{\substack{\phi_l \in B_{E'_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\phi_1(\varphi_{1,j}) \cdots \phi_n(\varphi_{n,j})|^p. \end{aligned}$$

So, it follows that $\|T_u(x_1, \dots, x_n)\| \leq \|T_u\|_{f,p} \|x_1\| \cdots \|x_n\|$ and we have (a).

- (b) Take $\varphi_l \in E'_l$, $l = 1, \dots, n$, and $b \in F$. It is immediate that $\|\varphi_1 \times \dots \times \varphi_n b\|_{f,p} \leq \|\varphi_1\| \cdots \|\varphi_n\| \cdot \|b\|$. To prove the reverse inequality we use (a). For every $x_l \in E_l$, $l = 1, \dots, n$, we have

$$\begin{aligned} |\varphi_1(x_1)| \cdots |\varphi_n(x_n)| \|b\| & \leq \|\varphi_1 \times \dots \times \varphi_n b\| \|x_1\| \cdots \|x_n\| \\ & \leq \|\varphi_1 \times \dots \times \varphi_n b\|_{f,p} \|x_1\| \cdots \|x_n\|. \end{aligned}$$

Taking the supremum over B_{E_l} , $l = 1, \dots, n$, we see that $\|\varphi_1\| \cdots \|\varphi_n\| \cdot \|b\| \leq \|\varphi_1 \times \dots \times \varphi_n b\|_{f,p}$.

QED

By Proposition 12(b) we see that $\|\varphi_1 \times \dots \times \varphi_n b\|_{f,p} = \|\varphi_1 \times \dots \times \varphi_n b\|_{si,p}$ for every $\varphi_l \in E'_l$, $l = 1, \dots, n$, and every $b \in F$ with $p \geq 1$. We do not know if $\|T\|_{f,p} = \|T\|_{si,p}$ whenever $T \in \mathcal{L}_f(E_1, \dots, E_n; F)$.

13 Remark. When E_1, \dots, E_n are reflexive Banach spaces the norm $\|\cdot\|_{f,p}$ on $\mathcal{L}_f(E_1, \dots, E_n; F)$ reduces to the following equivalent formulation: Given $T \in \mathcal{L}_f(E_1, \dots, E_n; F)$, we have that

$$\|T\|_{f,p} = \inf \|(\lambda_j)_{j=1}^m\|_q \left(\sup_{\substack{x_l \in B_{E_l} \\ l=1, \dots, n}} \sum_{j=1}^m |\varphi_{1,j}(x_1) \cdots \varphi_{n,j}(x_n)|^p \right)^{1/p} \| (b_j)_{j=1}^m \|_\infty$$

where the infimum is taken over all representations of T as in (2), and $q \geq 1$ with $\frac{1}{p} + \frac{1}{q} = 1$.

Next result provides a relation between $(\mathcal{L}_{si,p}(E'_1, \dots, E'_n; F'), \|\cdot\|_{si,p})$ and $(\mathcal{L}_f(E_1, \dots, E_n; F), \|\cdot\|_{f,p})$, which gives a predual of $(\mathcal{L}_{si,p}(E'_1, \dots, E'_n; F'), \|\cdot\|_{si,p})$, and also shows another predual of $(\mathcal{L}_{si,p}(E_1, \dots, E_n; F'), \|\cdot\|_{si,p})$ in case of E_1, \dots, E_n being reflexive spaces.

14 Proposition. *Let E_1, \dots, E_n be Banach spaces and let $p \geq 1$.*

- (a) *Then $(\mathcal{L}_{si,p}(E'_1, \dots, E'_n; F'), \|\cdot\|_{si,p})$ is isometrically isomorphic to $(\mathcal{L}_f(E_1, \dots, E_n; F), \|\cdot\|_{f,p})'$ by the mapping*

$$T(\psi)(\varphi_1, \dots, \varphi_n)(b) = \psi(\varphi_1 \times \cdots \times \varphi_n b),$$

where $b \in F$, $\varphi_l \in E'_l$, $l = 1, \dots, n$, and $\psi \in (L_f(E_1, \dots, E_n; F), \|\cdot\|_{f,p})'$.

If, in addition, E_1, \dots, E_n are reflexive Banach spaces then

- (b) *$(\mathcal{L}_{si,p}(E_1, \dots, E_n; F'), \|\cdot\|_{si,p})$ and $(\mathcal{L}_f(E'_1, \dots, E'_n; F), \|\cdot\|_{f,p})'$ are isometric via the mapping*

$$T(\psi)(x_1, \dots, x_n)(b) = \psi(x_1 \times \cdots \times x_n b),$$

where $b \in F$, $x_l \in E_l$, $l = 1, \dots, n$, and $\psi \in (\mathcal{L}_f(E'_1, \dots, E'_n; F), \|\cdot\|_{f,p})'$.

PROOF. (a) follows from Propositions 6 and 12 and (b) is a straightforward consequence of (a) \square

In the next by combining the previous results and taking $F = \mathbb{K}$, in particular, we obtain the following.

15 Corollary. *Let E_1, \dots, E_n be Banach spaces and let $p \geq 1$. Then the following isometries hold true:*

- (a) $(\mathcal{L}_{si,p}(E'_1, \dots, E'_n), \|\cdot\|_{si,p}) \cong (E'_1 \otimes \cdots \otimes E'_n; \sigma_p)' \cong (E'_1 \otimes \cdots \otimes E'_n \otimes \mathbb{K}; \tilde{\sigma}_p)' \cong (\mathcal{L}_f(E_1, \dots, E_n), \|\cdot\|_{f,p})'$

If, in addition, E_1, \dots, E_n are reflexive Banach spaces then the following isometries hold true:

$$(b) (\mathcal{L}_{si,p}(E_1, \dots, E_n), \|\cdot\|_{si,p}) \cong (E_1 \otimes \dots \otimes E_n; \sigma_p)' \cong (E_1 \otimes \dots \otimes E_n \otimes \mathbb{K}; \tilde{\sigma}_p)' \cong (\mathcal{L}_f(E'_1, \dots, E'_n), \|\cdot\|_{f,p})'.$$
